Communitising Technology

Chapter Description

- Aims
  - Basic of Computer Graphics.

- Expected Outcomes
  - Understand the basic concept of computer graphics. (CO1: Knowledge)
  - Ability to use the computer graphics technology. (CO1: Knowledge)

- References
  - Computer Graphics by Zhigang Xiang, Schaum's Outlines.
  - Donald Hearn & M. Pauline Baker, Computer Graphics with OpenGL, 4th Edition, Boston : Addison Wesley, 2011.

Communitising Technology

Simple way to start

Equation of a circle:

$$(x - x_0)^2 + (y - y_0)^2 = r^2$$

If we solve for *y*:

$$y = y_0 \pm \sqrt{r^2 - (x - x_0)^2}$$

Sample C codes:

```c
void SIMPLE_CIRCLE(int X_center, int Y_center, int radius_R, Color c) {
    int x, y, r2;
    r2 = radius_R * radius_R;
    for (x = - radius_R; x <= radius_R; x++) {
        y = (int)(sqrt(r2 - x*x) + 0.5);
        setPixel((X_center + x), (Y_center + y, c));
        setPixel((X_center + x), (Y_center - y, c));
    }
}
```

Communitising Technology

Simple way to start "uncertainty"

> In certain cases, the slope of the line tangent is greater than 1. Therefore, tangent > 1 shows the uncertainty of this algorithm.

> Looping (or stepping) using *x* won't work here.
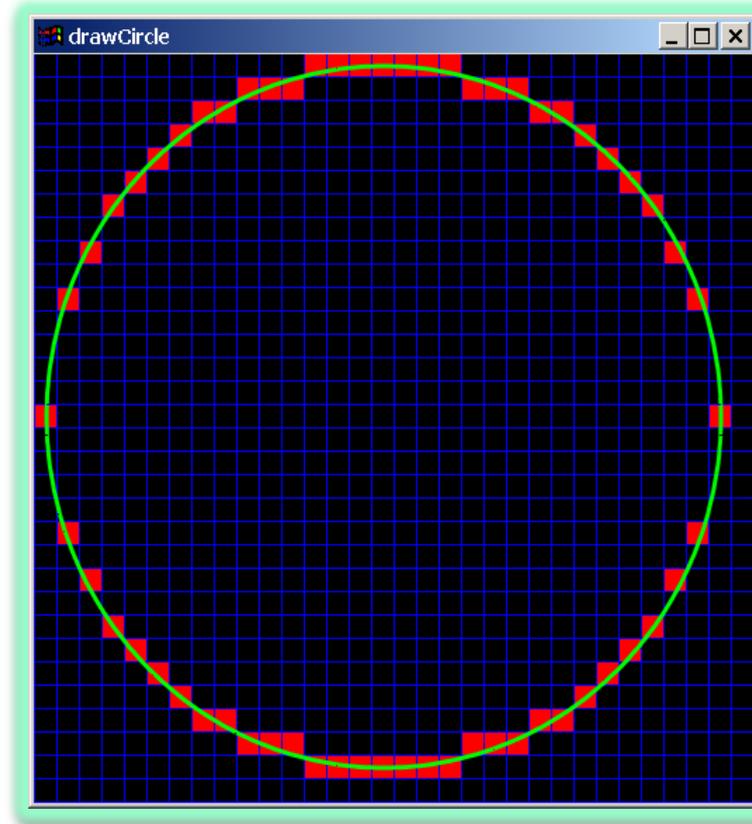

Reference: Computer Graphics: Principles and Practice by James D. Foley and et.al.

Circles symmetrical nature

> To solve the issue "slope of the tangent"

> Let's take the advantage of the circle's symmetric nature.

> Consider both positive and negative values for *y* (or x).
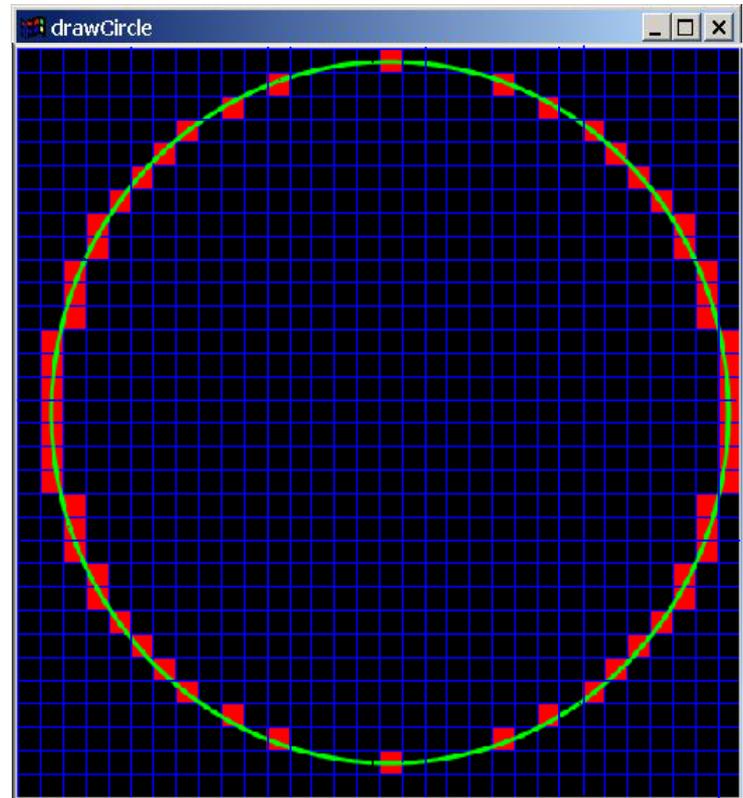

Midpoint Circle Algorithm

- Consider current point is at (x_k, y_k)
- Next point: (x_k+1, y_k), or (x_k+1, y_k-1)?
- Take the midpoint: (x_k+1, y_k-0.5)

- **Use the discriminator function to decide:**

$$f(x, y) = x^2 + y^2 - r^2$$

Circle path

Midpoint

Using the circle discriminator

Based on the value return:

$$f(x, y) \begin{cases} < 0 & \text{inside the circle} \\ = 0; & \text{on the circle path} \\ > 0; & \text{outside the circle} \end{cases}$$

By using the midpoint between 2 pixel candidates, we can introduce a decision parameter, p_k, to decide which to plot next:

1)
$$p_k = f(x_k + 1, y_k - 0.5)$$
$$= (x_k + 1)^2 + (y_k - 0.5)^2 - r^2$$

2 and 3)

$$p_k \begin{cases} \text{-ve: midpoint is inside the circle; plot } (x_k+1, y_k) \\ \text{+ve: midpoint is outside the circle; plot } (x_k+1, y_k-1) \end{cases}$$

Communitising Technology

If the current point is inside the circle …

If $p_k < 0$

We want to know $f(x+1, y)$ so we can update p:

$$f(x+1, y) = (x + 1)^2 + y^2 - r^2$$

$$f(x+1, y) = (x^2 + 2x + 1) + y^2 - r^2$$

$$f(x+1, y) = f(x, y) + 2x + 1$$

$$\underset{P_{k+1}}{\qquad} \underset{P_k}{\qquad}$$

So we increment:

$$p \mathrel{+}= 2x + 1$$

The Comprehensive Academic Study Platform for University Students in Bangladesh (www.onebyzeroedu.com)

Communitising Technology

If the current point is outside the circle …

If $p_k > 0$

Let's drop the subscript for a while…

We want to know $f(x+1, y-1)$ so we can update p:

$$f(x+1, y-1) = (x + 1)^2 + (y - 1)^2 - r^2$$

$$f(x+1, y-1) = (x^2 + 2x + 1) + (y^2 - 2y + 2) - r^2$$

$$f(x+1, y-1) = \underset{\textcolor{brown}{\boldsymbol{P_{k+1}}}}{f(x, y)} + \underset{\textcolor{brown}{\boldsymbol{P_k}}}{\quad} 2x - 2y + 2$$

And we increment:

$$p \mathrel{+}= 2x - 2y + 2$$

Communitising Technology

Where to begin?

We can determine where to go next, how do we start?

We have a variety of choices for our first point on the circle, but we've designed the increments to work from $(0, r)$.

Calculate initial value of p_0 by evaluating:

$$p_0 = f(1, r–0.5) = 1^2 + (r − 0.5)^2 − r^2$$

$$p_0 = f(1, r–0.5) = 1 + (r^2 − r + 0.25) − r^2$$

$$p_0 = 1.25 − r$$

**We want to use integer calculation; you can round p_0

# Midpoint circle algorithm

Homework

Ellipse Drawing

Equation

General equation of an ellipse:

$$\sqrt{(x-x_1)^2 + (y-y_1)^2} + \sqrt{(x-x_2)^2 + (y-y_2)^2} = \text{constant}$$
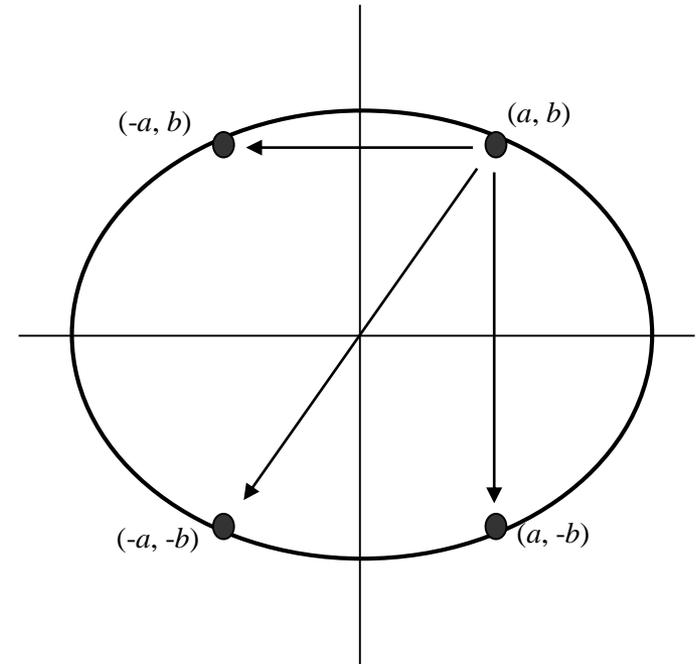

$d_1 + d_2 = \text{constant}$

Or,

$$\left(\frac{x-x_c}{r_x}\right)^2 + \left(\frac{y-y_c}{r_y}\right)^2 = 1$$

Symmetry

An ellipse only has a
2-way symmetry.

Communitising Technology

Equation of an ellipse revisited

Consider an ellipse centered at the origin:

$$\left(\frac{x}{r_x}\right)^2 + \left(\frac{y}{r_y}\right)^2 = 1$$

What is the discriminator function?

$$f_e(x, y) = r_y^{\ 2}x^2 + r_x^{\ 2}y^2 - r_x^{\ 2}r_y^{\ 2}$$

…and its properties:

$f_e(x,y) < 0$ for a point inside the ellipse

$f_e(x,y) > 0$ for a point outside the ellipse

$f_e(x,y) = 0$ for a point on the ellipse

Communitising Technology

Midpoint Ellipse Algorithm

- Ellipse is different from circle.
- Similar approach with circle, different is sampling direction.
- Region 1:
  - Sampling is at *x* direction
  - Choose between (x_k+1, y_k), or (x_k+1, y_k-1)
  - Midpoint: $(x_k+1, y_k-0.5)$
- Region 2:
  - Sampling is at *y* direction
  - Choose between (x_k, y_k-1), or (x_k+1, y_k-1)
  - Midpoint: $(x_k+0.5, y_k-1)$

Slope = -1

Region 1

Region 2
